Claim 6; Fig 1; 58pp; English.
This sequence represets human eph/elk-like kinase (HEK). HEK is expressed in both pre-B cells and T cell lines and in a number of tumours of human origin, eg. lymphoid tumours LK63, Lila-1 and JM, and the epithelial tumour HELA. This receptor-type thymidine kinase and the epithelial tumour HELA.

Probes derived from the EPH-related PTKs Cek4 (Q90659) and Ce (Q90660) were used to isolate novel cDNA clones (Q90652-58, Q90661-62) from chicken embryo and embryonic brain libraries. Cek4 is highly expressed in the chicken developing brain and embryonic tissues and also in the adult brain and retina.

The nucleic acid sequence encoding Bsk can be used in Bsk nucleic acid probes, which can be used in detecting alterations in the level of Bsk messenger-RNA (mRNA) in biological samples isolated from a mammal afflicted with a disease, such as neurodegenerative diseases or disorders and neoplasms. The nucleic acid sequence can all be delivered into the limbic system of patients with limbic system neurodegenerative disease, disorder or injury, to promote or enhance limbic system neuron regeneration or growth. Such neurodegenerative diseases include, chromosomal abnormalities, degenerative growth and development disorders, viral infections, bacterial infections, brain injuries, neoplastic conditions, Alzheimer's disease, epilepsy, schizopheratics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Isolated nucleic acid sequence encoding protein - used in nucleic acid probes, used in detecting alterations in lever messenger-RNA in biological samples isolated from mammal a

The angiogenesis-related conditions.

Example 1; Page 50-53; 75pp; English.

Creat REK7 (R97853) is an eph-related tyrosine kinase receptor, for which AL-1 (see also W97854) is a ligand. Its amino acid sequence which AL-1 (see also W97854) is a ligand. Its amino acid sequence considered from a cDNA clone (T18893) isolated from a hippocampal cDNA library. An REK-IgG fusion was used to screen cultured cell lines for surface expression of REK7-binding activity. Primers considered ligands were used to amplify human breast carcinoma BT20 cell cDNA, and an amplified fragment was used to screen a human contains and considered ligands were used to amplify human breast carcinoma breast carcinoma BT20 cell cDNA, and an amplified fragment was used to screen a human contains and considered ligands were used to amplify human breast carcinoma BT20 cell cDNA, and an amplified fragment was used to screen a human contains and considered ligands were used to amplify human breast carcinoma BT20 cell cDNA, and an amplified fragment was used to screen a human contains and conta

Disclosure; Page 95-99; 125pp; English.
DNA probes based on protein tyrosine-kinase (pTK) sequences were used to screen cDNA libraries to identify novel pTK genes. The bpTKS, bpTK3, bpTK4, bpTK5 and bpTK7 (R85924-28 and R85935, respectively) are expressed in human brain tissue and show homology to known pTKs. A full-length sequence for bpTK7 (R85936) was also obtd. bpTK7 can be used to design drugs that modulate pTK activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       26-JUL-1991;

Also described are the corresponding profeor-1; Ror-2; Ehk-1; and Ehk-2. The proteins are orphan receptor tyrosine kinases. The present sequence represents rat Ehk-1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A Rovel human EPH-like receptor protein tyrosine kinases, HEK7, HEK8 and HEK11 (R85089-92), respectively, were identified following isolation of their encoding cDNAs (T02946-49) from a human foetal brain cDNA library. HEK5, HEK7 and HEK8 show extensive homology to the catalytic domain of chicken EPH-like receptors Cek5, Cek7 and Cek8. HEK11 shows no homology to any known EPH-like receptor. Recombinant HEK receptors (or their soluble extracellular domains) are produced by expression of encoding sequences in procaryotic or encaryotic host cells, and are used to produce antibodies (utilised in diagnostic assays), or to identify and purify ligands for HEK receptors, or therapeutically to modulate the activation of cell-associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New nucleic acid encoding EPH-like and related vectors, host cells, pr diagnostically and therapeutically
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    11-FEB-1999 (first entry)
Rat receptor tyrosine kinase Ehk-2.
Receptor tyrosine kinase; Ror-1; Ror-2; Ehk-1; Ehk-2; neurotrophin activity; trkB; proto-oncogene; tyrosine binding protein; BDNF; NT-3; diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           or prodn.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes nucleic acid molecules for ror-1, ror-2, ehk-1 and ehk-2. Also described are the corresponding prot Ror-1; Ror-2; Ehk-1; and Ehk-2. The proteins are orphan receptor tyrosine kinases. The present sequence represents rat Ehk-2. Sequence 948 AA;

Novel mouse embryonic stem cell kinase (Esk) is a receptor tyrosine kinase that belongs to the Eph subfamily. Its amino acid sequence was deduced from a DNA molecule (T72320) isolated from a murine liver cDNA library. Recombinant Esk polypeptides, esp. soluble Esk (extracellular domain), can be produced in host cells and used for ligand isolation, as antagonists of Esk-ligand interaction and as immunogens for prodn. of antibodies useful as diagnostic reagents or therapeutic antagonists of Modulation of Esk expression can be used to treat mucositis (partic. when caused by cancer treatment), and as Esk is expressed in all epithelial tissues its modulation may be used to treat e.g. skin injuries, hair loss, corneal or peptic ulcers, ulcerative colitis, oesophageal reflex, sjorgren's syndrome and related autoimmune disease, mucosal infections and pancreatitis.
                                                                                                                                                                                                                                                                               Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       4 Novel human EPH-like receptor protein tyrosine kinases, HEK5, HEK7 HEK8 and HEK11 (R85089-92), respectively, were identified following isolation of their encoding cDNAs (T02946-49) from a human foetal brodNA library. HEK5, HEK7 and HEK8 show extensive homology to the catalytic domain of chicken EPH-like receptors Cek5, Cek7 and Cek8. HEK11 shows no homology to any known EPH-like receptor. Recombinant HEK receptors (or their soluble extracellular domains) are produced expression of encoding sequences in procaryotic or eucaryotic host cells, and are used to produce antibodies (utilised in diagnostic assays), or to identify and purify ligands for HEK receptors, or therapeutically to modulate the activation of cell-associated
                                                                                                                                                                                                                                                                                                                         Mouse developmental kinase 1 MDK1 T1.

CDNA cloning using adult mouse brains and Northern blotting identified 2 truncated versions, MDKI T1 (W03422) and MDKI T2 (W03423), of the novel mouse developmental kinase 1 (MDKI) (see also W03421), a new member of the eck/eph family of receptor tyrosine kinases. Their amino acid sequences were deduced from cDNA clones (T32961 and T32962) obtd. from adult mouse brains. MDK T1 and T2 each possess the entire ectodomain, the transmembrane domain and part of the juxtamembrane region of MDK1, but lack the catalytic tyrosine kinase domain. They can be used to screen for potential agents useful for treatment of diseases characterised by abnormal signal transduction.

SExample 1; Page 105-108; 128pp; English.

Concluse developmental kinase 1 (MDK1) (W03421) is a new member of the ceck/eph family of receptor tyrosine kinases (RTKs). Its amino call sequence was deduced from a cDMA clone (T32960) isolated from mouse embryo and adult brain libraries. The distinct patterns of MDK1 expression during mouse development suggest an comportant role for MDK1 in the formation of neuronal structures. Composition of the diagnosis of diseases characterised by abnormality in a signal transduction pathway, such as neuroproliferative or neurodegenerative disorders or cancer, to screen for (ant)agonists, and to raise antibodies.

PT Imman and yeast alanyl-tRNA synthetase genes - useful for production of recombinant enzymes for diagnostic and analytical applications PS Claim 3; Column 43-48; A2p; English.

CC W19968 shows the amino acid sequence of human alanyl-tRNA synthetase CC (Ala-tRS). Human Ala-tRS and antibodies specific for it, may be useful CC in assays for diagnosing and monitoring an autoimmune disease known as CC antisynthetase syndrome. A condition in which patients having CC polymyositis and/or dermatomyositis produce antibodies against the cessential synthetase enzyme. Anti-synthetase syndrome is characterised by a number of clinical presentations, including interstitial lung CC disease, arthritis, Raynaud's phenomenon and fever. Human Ala-tRS can CC on human Ala-tRS. Tester strains comprising host cells containing CC function of the native gene which complements or substitutes the CC function of the native gene can be used to test for any toxic effects of such antimicrobial agents that specifically interacts with the human CC Ala-tRS gene or protein. Ala-tRS proteins can be used to separate CC alanine from other amino acids, to separate L-alanine from D-alanine, CC Guantitative determination of alanine or Aff.

ONE OF THE IN-VIVO FUNCTION OF THIS ENZYME IS THE ADDITION OF NUCLEOTIDES AT THE JUNCTION OF THIS ENZYME IS THE ADDITION OF RUCLEOTIDES AT THE JUNCTION (N REGION) OF REARRANGED IG HEAVY CHAIN AND T CELLS.

-I- CATALYTIC ACTIVITY: N DEOXYNUCLEOSIDE TRIPHOSPHATE + (DEOXY NUCLEOTIDE)(M) = N PYROPHOSPHATE + (DEOXYNUCLEOTIDE)(M+N).

-I- COFACTOR: REQUIRES MAGNESIUM.
-I- SUBCELLULAR LOCATION: NUCLEAR (TDT-S) OR CYTOPLASMIC (TDT-L).

-I- ALTERNATIVE PRODUCTS: TWO ISOFORMS; TDT-L/ARGE) (SHOWN HERE) AND IN ACTIVITY AS THE LONG CYTOPLASMIC FORM CAN NOT ACT ON N DEOXYNUCLEOTITY AS THE LONG CYTOPLASMIC FORM CAN NOT ACT ON N
                                                                                     Saccharomyces cerevisiae (Baker's yeast).

SUBCELLAULAR LOCATION: EXTRACELLULAR.
MISCELLANEOUS: PULMONARY SURFACTANT CONSISTS OF 90% LIPID AND 10%
PROTEIN. THERE ARE 4 SURFACTANT ASSOCIATED PROTEIN: 2 COLLAGENOUS,
CARBOHYDRATE-BINDING GLYCOPROTEINS (SP-A AND SP-D) AND 2 SMALL
HYDROPHOBIC PROTEINS (SP-B AND SP-C).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ; 165:285-290(1995).
FUNCTION: PULMONARY SURFACTANT ASSOCIATED PROTEINS PROMOTE
ALVEOLAR STABILITY BY LOWERING THE SURFACE TENSION AT THE AIR-
LIQUID INTERFACE IN THE PERIPHERAL AIR SPACES. SP-B INCREASES
THE COLLAPSE PRESSURE OF PALMITIC ACID TO NEARLY 70 MILLINEWTONS
